

CLI 매뉴얼

목차

- 개요
- 설치 및 환경 설정
- CLI 사용법과 예제

개요

본 문서는 kt cloud CLI(Command Line Interface)를 설명하는 문서이다. 이용하는 Python 버전은 3.8 기준이다.

설치 및 환경설정

설치

설치 방법

- kt cloud 홈페이지 자료실에서 내려받은 ktcloud_CLI_{version}.zip를 작업 디렉토리에 복사한 뒤 압축을 해제한다.

라이브러리

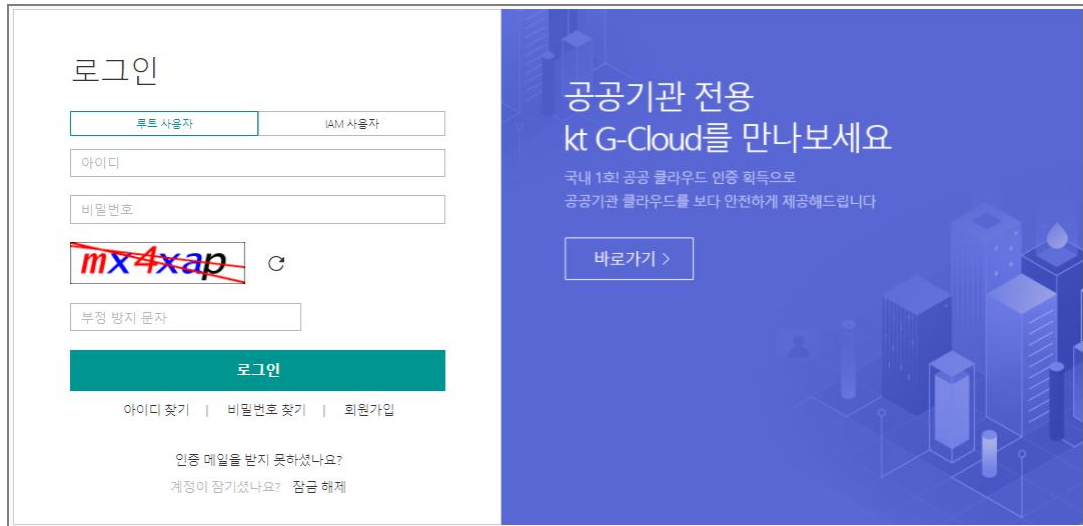

- CLI를 이용하기 위해서는 다음 라이브러리가 필요하다.

- pandas==1.1.4
- requests==2.25.0
- urllib3==1.26.2

계정정보 확인

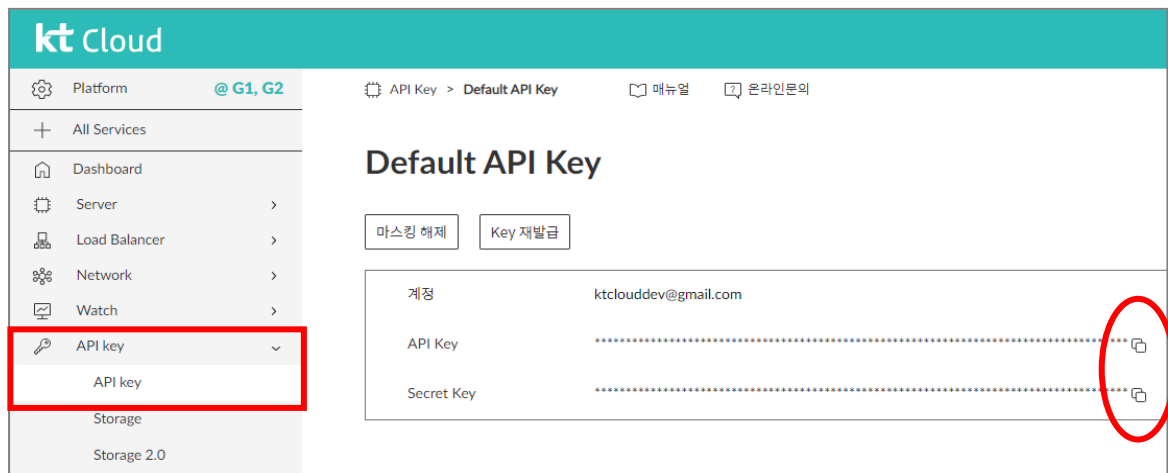

Key값 확인하기

kt cloud 홈페이지에 접속하고 로그인한다.

The image shows the kt Cloud login page. On the left, there is a '로그인' (Login) section with fields for '아이디' (ID) and '비밀번호' (Password), a '로그인' (Login) button, and links for '아이디 찾기' (Find ID), '비밀번호 찾기' (Find Password), and '회원가입' (Sign Up). There is also a '부정 방지 문자' (Anti-fraud text) field. On the right, there is a blue banner for '공공기관 전용 kt G-Cloud를 만나보세요' (Meet kt G-Cloud for public institutions), with a '바로가기 >' (Go) button.

API Key 메뉴에서 API Key와 Secret Key를 복사한다.

The image shows the kt Cloud API Key page. The left sidebar has a menu with 'API key' highlighted. The main content area is titled 'Default API Key' and shows the '계정' (Account) as 'ktclouddev@gmail.com'. Below this, there are fields for 'API Key' and 'Secret Key', both of which are masked with dots. To the right of each field is a copy icon, which is circled in red. There are also buttons for '마스킹 해제' (Unmask) and 'Key 재발급' (Reissue Key).

환경 설정

환경변수 선언

터미널에서 환경변수를 다음과 같이 설정한다. 아래 환경변수는 터미널 창이 닫히면 더이상 유효하지 않다.

```
#>export KTCAP1={Your API Key}
```

```
#>export KTCSEC={Your Secret Key}
```

[illegible]

환경변수 저장

bashrc 파일에 KTCAP1, KTCSEC 2개 항목을 추가하면 터미널 창이 닫히더라도 변수가 저장된다.

```
#>vim ~/.bashrc
```

```
#>source ~/.bashrc
```

[illegible]

```
user@DESKTOP-SK5DCB8 /m/c/d/w/t/ktcloud_sdk> vim ~/.bashrc
user@DESKTOP-SK5DCB8 /m/c/d/w/t/ktcloud_sdk> source ~/.bashrc
```

CLI 사용법과 예제

Server 명령어

1. listZones : 사용 가능한 모든 zone 조회

- EX> python ktcloud.py server listZones

```
user@DESKTOP-SK5DCB8 /m/c/d/w/ktcloud_cli> python ktcloud.py server listZones
-----
[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances
-----
Input Your MSG : server listZones []
-----
[ktcloud] Result
{'listzonesresponse': {'zone': [{'id': 'eceb5d65-6571-4696-875f-5a17949f3317', 'networktype': 'Advanced', 'securitygroupsena
bled': False, 'allocationstate': 'Enabled', 'dhcpprovider': 'VirtualRouter', 'localstorageenabled': False, 'tags': [], 'name
```

2. checkVirtualMachineName : VM 표시이름 중복체크

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- display_name : VM 표시이름
- EX> python ktcloud.py server checkVirtualMachineName zone='KR-M'
display_name='mytestVM'
- 'displaytext': '실패' => 이름 중복
- 'displaytext': '성공' => 이름 사용가능

```
user@DESKTOP-SK5DCB8 /m/c/d/w/ktcloud_cli> python ktcloud.py server checkVirtualMachineName zone='KR-M' display_name='mytestVM'
-----
[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances
-----
Input Your MSG : server checkVirtualMachineName ['zone=KR-M', 'display_name=mytestVM']
-----
[ktcloud] Result
{'checkvirtualmachinename': {'displaytext': '성공', 'Success': 'true'}}
```

3. listAvailableProductTypes : VM 상품들 정보 조회

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- EX> python ktcloud.py server listAvailableProductTypes zone='KR-M'

```

user@DESKTOP-SK5DCB8 /m/c/d/w/ktcloud_cli> python ktcloud.py server listAvailableProductTypes zone='KR-M'
-----
[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                        python ktcloud.py database listInstances
-----
Input Your MSG : server listAvailableProductTypes ['zone=KR-M']
-----
[ktcloud] Result
{'listavailableproducttypesresponse': {'count': 1445, 'producttypes': [{'diskofferingdesc': '100GB', 'diskofferingid': '87c0a6f6-c684-4fbe-a393-d8412bcf788d', 'product': 'Standard', 'productid': 'std_rhel 7.0 64bit en_1x1', 'productstate': 'availab
a6f6-c684-4fbe-a393-d8412bcf788d', 'product': 'Standard', 'productid': 'std_rhel 7.0 64bit en_1x1', 'productstate': 'availab

```

4. deployVirtualMachine : 신규 VM 생성

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- serviceofferingid : 서비스 제공 ID (CPU, Memory 조합)
- templateid : 템플릿 ID
- diskofferingid : 디스크 제공 ID
- name : VM 이름 (Optional)
- EX> python ktcloud.py server deployVirtualMachine zone='KR-M'
diskofferingid='87c0a6f6-c684-4fbe-a393-d8412bcf788d'
serviceofferingid='f86f09f6-9acf-4b30-936c-cfb409a89e68'
templateid='60b1376f-c576-440e-b36f-9b8b39b05104'
- * serviceofferingid, templateid, diskofferingid 는 아래 사이트 참조

https://cloud.kt.com/portal/openapi-guide/computing_enterprise-Server-server_api_make

```

python ktcloud.py server deployVirtualMachine zone='KR-M' diskofferingid='87c0a6f6-c684-4fbe-a393-d8412bcf788d' serviceofferingid='f86f09f6-9acf-4b30-936c-cfb409a89e68' templateid='60b1376f-c576-440e-b36f-9b8b39b05104' name='clitest'
-----
[ktcloud] ctype      : server database loadbalancer gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                        python ktcloud.py database listInstances
-----
Input Your MSG : server deployVirtualMachine ['zone=KR-M', 'diskofferingid=87c0a6f6-c684-4fbe-a393-d8412bcf788d', 'serviceofferingid=f86f09f6-9acf-4b30-936c-cfb409a89e68', 'templateid=60b1376f-c576-440e-b36f-9b8b39b05104', 'name=clitest']
-----
[ktcloud] Result
{'deployvirtualmachineresponse': {'id': 'bc4d8428-132f-4893-8312-6ab479eae94', 'jobid': '5db576e4-f4f2-4788-8f95-a2b534e10b13', 'rootid': 'c8270c8f-0384-419f-9020-bed1752e8757'}}

```

5. listVirtualMachines : VM 리스트 조회

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- EX> python ktcloud.py server listVirtualMachines zone='KR-M'

```

user@DESKTOP-R54AST2 /m/h/w/ktcloud_sdk> python ktcloud.py server listVirtualMachines zone='KR-M'
-----
[ktcloud] ctype      : server database loadbalancer gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                        python ktcloud.py database listInstances
-----
Input Your MSG : server listVirtualMachines ['zone=KR-M']
-----
[ktcloud] Result
{'listvirtualmachinesresponse': {'virtualmachine': [{'id': 'e6a49993-f10e-465b-b7ad-2403f044ce6e', 'name': 'test001', 'displayname': 'test001', 'account': 'EPC_M191867_S1820', 'userid': '8a720fc0-d741-444a-a551-aa7c859bbc20', 'username': 'E

```

6. destroyVirtualMachine : VM 파기

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- id : VirtualMachine ID
 - * id는 웹콘솔 또는 listVirtualMachines 등으로 확인 가능
 - * VM 정지 상태에서 삭제 가능
- EX> python ktcloud.py server destroyVirtualMachine zone='KR-M' id='a7552b33-9414-42d5-93e8-6732095ce427'

```

user@DESKTOP-R54AST2 /m/h/w/ktcloud_sdk>
python ktcloud.py server destroyVirtualMachine zone='KR-M' id='2b4ff40f-a3b4-4eb6-8283-7a7561b2fb7f'
-----
[ktcloud] ctype      : server database loadbalancer gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                        python ktcloud.py database listInstances
-----
Input Your MSG : server destroyVirtualMachine ['zone=KR-M', 'id=2b4ff40f-a3b4-4eb6-8283-7a7561b2fb7f']
-----
[ktcloud] Result
{'destroyvirtualmachineresponse': {'jobid': '6b1ec142-4fd6-4a0d-b294-7f535dce19a3'}}

```

7. stopVirtualMachine : VM 정지

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- id : VirtualMachine ID
- EX> python ktcloud.py server stopVirtualMachine zone='KR-M' id='394c1077-8816-4fce-b371-d3ffea2859e5'

```

user@DESKTOP-R54AST2 /m/h/w/ktcloud_sdk>
python ktcloud.py server stopVirtualMachine zone='KR-M' id='2b4ff40f-a3b4-4eb6-8283-7a7561b2fb7f'
-----
[ktcloud] ctype      : server database loadbalancer gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                        python ktcloud.py database listInstances
-----
Input Your MSG : server stopVirtualMachine ['zone=KR-M', 'id=2b4ff40f-a3b4-4eb6-8283-7a7561b2fb7f']
-----
[ktcloud] Result
{'stopvirtualmachineresponse': {'jobid': 'b929e1da-28fb-4321-9ead-a6fe2202c38b'}}

```

8. startVirtualMachine : VM 시작

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- id : VirtualMachine ID
- EX> python ktcloud.py server startVirtualMachine zone='KR-M' id='394c1077-8816-4fce-b371-d3ffea2859e5'

```
user@DESKTOP-R54AST2 /m/h/w/ktcloud_sdk>
python ktcloud.py server startVirtualMachine zone='KR-M' id='bc4d8428-132f-4893-8312-6ab479eae94'
```

```
[ktcloud] ctype      : server database loadbalancer gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                        python ktcloud.py database listInstances
```

```
Input Your MSG : server startVirtualMachine ['zone=KR-M', 'id=bc4d8428-132f-4893-8312-6ab479eae94']
```

```
[ktcloud] Result
{'startvirtualmachineresponse': {'jobid': '3d96c585-6c3c-49fb-8470-e7eda60a39df'}}
```

9. rebootVirtualMachine : VM 재시작

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- id : VirtualMachine ID
- EX> python ktcloud.py server rebootVirtualMachine zone='KR-M' id='394c1077-8816-4fce-b371-d3ffea2859e5'

```
user@DESKTOP-R54AST2 /m/h/w/ktcloud_sdk>
python ktcloud.py server rebootVirtualMachine zone='KR-M' id='bc4d8428-132f-4893-8312-6ab479eae94'
```

```
[ktcloud] ctype      : server database loadbalancer gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                        python ktcloud.py database listInstances
```

```
Input Your MSG : server rebootVirtualMachine ['zone=KR-M', 'id=bc4d8428-132f-4893-8312-6ab479eae94']
```

```
[ktcloud] Result
{'rebootvirtualmachineresponse': {'jobid': '5f9ec12a-5f90-464b-9dfb-fda74341ac29'}}
```

10. resetPasswordForVirtualMachine : VM 패스워드 재설정

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- id : VirtualMachine ID
- EX> python ktcloud.py server resetPasswordForVirtualMachine zone='KR-M' id='394c1077-8816-4fce-b371-d3ffea2859e5'

```

user@DESKTOP-R54AST2 /m/h/w/ktcloud_sdk>
python ktcloud.py server resetPasswordForVirtualMachine zone='KR-M' id='bc4d8428-132f-4893-8312-6ab479eae94'
-----
[ktcloud] ctype      : server database loadbalancer gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                        python ktcloud.py database listInstances
-----
Input Your MSG : server resetPasswordForVirtualMachine ['zone=KR-M', 'id=bc4d8428-132f-4893-8312-6ab479eae94']
-----
[ktcloud] Result
{'resetpasswordforvirtualmachineresponse': {'jobid': '67adf25b-0a9f-467e-bc7b-913cfcba4598'}}

```

11. restoreVirtualMachine : VM 디스크 초기화

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- virtualmachineid : VirtualMachine ID
 - * VM 정지 상태에서 초기화 가능
- EX> python ktcloud.py server restoreVirtualMachine zone='KR-M'

virtualmachineid='394c1077-8816-4fce-b371-d3ffea2859e5'

```

user@DESKTOP-R54AST2 /m/h/w/ktcloud_sdk>
python ktcloud.py server restoreVirtualMachine zone='KR-M' virtualmachineid='bc4d8428-132f-4893-8312-6ab479eae94'
-----
[ktcloud] ctype      : server database loadbalancer gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                        python ktcloud.py database listInstances
-----
Input Your MSG : server restoreVirtualMachine ['zone=KR-M', 'virtualmachineid=bc4d8428-132f-4893-8312-6ab479eae94']
-----
[ktcloud] Result
{'restorevmresponse': {'jobid': 'f3db5641-fb04-4042-9505-31e41e24452d'}}

```

12. updateVirtualMachine : VM 표시이름 수정

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- id : VirtualMachine ID
- name : VM 이름
- displayname : VM 표시 이름
- EX> python ktcloud.py server updateVirtualMachine zone='KR-M' id='394c1077-8816-4fce-b371-d3ffea2859e5' name='CLITestVM'

```

user@DESKTOP-R54AST2 /m/h/w/kcloud_sdk>

```

Nas 명령어

1. addVolume: Volume 추가 생성

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- name : Volume 의 이름
- path : Volume 의 mount 포인트(영어, 숫자, '_', 최대 20 자 가능)
- totalsize : Volume 의 크기(기가) : 소수점은 지원하지 않습니다. 최소:500/ 최대:20000(정책에따라변동 가능)
- description: Volume 의 설명(optional)
- volumetype : nfs | cifs 중 선택
- usageplantype: Volume 과금 단위 : 시간 또는 월 [hourly | monthly] (default : hourly) (optional)
- networkid: Network 의 uuid
> Multi-Network 사용자는 생성할 Volume 의 network id 를 지정해야 한다.(listNetworks 로 확인 가능) (optional)

[KOR-SEOUL M2 존 전용]

- volumetype : nfs | cifs | iscsi 중 선택
- ostype: 생성된 볼륨이 연결될 서버의 OS 종류, 미입력시 linux 로 설정
>linux, windows(optional)
- disktype: 볼륨이 생성될 물리적 타입을 HDD와SSD 중 선택
>hdd, ssd(optional)
- EX> python ktcloud.py nas addVolume name=nas1 path=nas_1 totalsize=1000 volumetype=nfs zone=KR-M

```
C:\WCLI_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py nas addVolume name=nas1 path=nas_1 totalsize=1000 volumetype=nfs zone=KR-M

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances

Input Your MSG : nas addVolume ['name=nas1', 'path=nas_1', 'totalsize=1000', 'volumetype=nfs', 'zone=KR-M']

[ktcloud] Result
{'addvolumeresponse': {'status': 'success', 'response': {'daymaxcount': 0, 'status': 'online', 'filestotal': 0, 'ip': '10.28.122.136', 'path': 'nas_1', 'id': 8432, 'description': '', 'totalsize': 1073741824000, 'cifsworkgroup': '', 'usedsize': 0, 'scheduled': False, 'snapshottime': [], 'weekmaxcount': 0, 'removed': '', 'filesused': 0, 'maxsize': 0, 'incrementsize': 0, 'name': 'nas1', 'networkid': '001712da-b425-4d38-aa8a-6d79b3836dd1', 'created': '2021-01-06T17:06:46', 'volumetype': 'nfs', 'ostype': '', 'autoresize': False}}}
```

2. updateVolume: Volume의 정보 수정

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- id : Volume 의 ID
- name: Volume 의 이름(optional)
- description: Volume 설명(optional)
- totalsize: Volume 의 크기(기가) : 소수점은 지원하지 않습니다.(optional)
최소:500/ 최대:20000(정책에따라변동 가능)
- EX> python ktcloud.py nas updateVolume zone=KR-M id=8432 totalsize=2000
- * 블록스토리지(iSCSI) 볼륨의 경우, 최초 생성 후 볼륨 사이즈 변경 불가

```
C:\WCL\SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py nas updateVolume zone=KR-M id=8432 totalsize=2000

[ktcloud] ctype       : server database lb gslb nas waf
[ktcloud] command     : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage       : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example     : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                       python ktcloud.py database listInstances

Input Your MSG : nas updateVolume ['zone=KR-M', 'id=8432', 'totalsize=2000']

[ktcloud] Result
{'updatevolumeresponse': {'status': 'success', 'response': {'daymaxcount': 0, 'status': 'online', 'filetotal': 31876689, 'ip': '10.28.122.136', 'path': 'nas_1', 'id': 8432, 'description': '', 'totalsize': 2147483648000, 'cifsworkgroup': '', 'usedsize': 270336, 'scheduled': False, 'snapshottime': [], 'weekmaxcount': 0, 'removed': '', 'filesused': 96, 'maxsize': 0, 'incrementsize': 0, 'name': 'nas1', 'networkid': '001712da-b425-4d38-aa8a-6d79b3836dd1', 'created': '2021-01-06T17:06:46', 'volumetype': 'nfs', 'ostype': '', 'autoresize': False}}}
```

3. deleteVolume: Volume 삭제

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- id : Volume 의 ID
- EX> python ktcloud.py nas deleteVolume zone=KR-M id=8432

```
C:\WCL\SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py nas deleteVolume zone=KR-M id=8432

[ktcloud] ctype       : server database lb gslb nas waf
[ktcloud] command     : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage       : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example     : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                       python ktcloud.py database listInstances

Input Your MSG : nas deleteVolume ['zone=KR-M', 'id=8432']

[ktcloud] Result
{'deletevolumeresponse': {'status': 'success', 'response': {'daymaxcount': 0, 'status': 'expunging', 'filetotal': 31876689, 'ip': '10.28.122.136', 'path': 'nas_1', 'id': 8432, 'description': '', 'totalsize': 2147483648000, 'cifsworkgroup': '', 'usedsize': 270336, 'scheduled': False, 'snapshottime': [], 'weekmaxcount': 0, 'removed': '2021-01-06T18:12:43', 'filesused': 96, 'maxsize': 0, 'incrementsize': 0, 'name': 'nas1', 'networkid': '001712da-b425-4d38-aa8a-6d79b3836dd1', 'created': '2021-01-06T17:06:46', 'volumetype': 'nfs', 'ostype': '', 'autoresize': False}}}
```

4. getVolumeUsage: Volume의 사용량 확인

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- id : Volume 의 ID
- EX> python ktcloud.py nas getVolumeUsage zone=KR-M id=8433

```
C:\WCLI_SDK\WKT-Cloud-Toolkit-main (1)WKT-Cloud-Toolkit-main>python ktcloud.py nas deleteVolume zone=KR-M id=8432

[ktcloud] ctype       : server database lb gslb nas waf
[ktcloud] command     : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage       : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example     : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                        python ktcloud.py database listInstances

Input Your MSG : nas deleteVolume ['zone=KR-M', 'id=8432']

[ktcloud] Result
{'deletevolumeresponse': {'status': 'success', 'response': {'daymaxcount': 0, 'status': 'expunging', 'filestotal': 31976689, 'ip': '10.29.122.136', 'path': 'nas_1', 'id': 8432, 'description': '', 'totalsize': 2147483648000, 'cifsworkgroup': '', 'usedsize': 270336, 'scheduled': False, 'snapshottime': [], 'weekmaxcount': 0, 'removed': '2021-01-06T18:12:43', 'filesused': 96, 'maxsize': 0, 'incrementsize': 0, 'name': 'nas1', 'networkid': '001712da-b425-4d38-aa8a-6d79b3836dd1', 'created': '2021-01-06T17:06:46', 'volumetype': 'nfs', 'ostype': '', 'autoresize': False}}}
```

5. listVolumes: Volume의 목록 출력

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- id: Volume 의 ID * volumetype이 iscsi인 경우, lunuuid값으로 호출](optional)
- name: Volume 의 이름](optional)
- status: Volume 의 상태 [online | expunging | destroyed]](optional)
 - . online : 동작 중인 상태
 - . expunging : 삭제 중인 상태
 - . destroyed : 삭제된 상태
- volumetype: Volume 의 유형 [nfs | cifs](optional)
- EX> python ktcloud.py nas listVolumes zone=KR-M

```
C:\WCLI_SDK\WKT-Cloud-Toolkit-main (1)WKT-Cloud-Toolkit-main>python ktcloud.py nas listVolumes zone=KR-M

[ktcloud] ctype       : server database lb gslb nas waf
[ktcloud] command     : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage       : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example     : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                        python ktcloud.py database listInstances

Input Your MSG : nas listVolumes ['zone=KR-M']

[ktcloud] Result
{'listvolumesresponse': {'status': 'success', 'count': 43, 'response': [{'daymaxcount': 0, 'status': 'destroyed', 'filestotal': 31129581, 'ip': '10.17.31.73', 'path': 'mqnfs01', 'id': 8308, 'description': '', 'totalsize': 1073741824000, 'cifsworkgroup': '', 'usedsize': 147456, 'scheduled': False, 'snapshottime': [], 'weekmaxcount': 0, 'removed': '2020-11-19T15:58:34', 'filesused': 96, 'maxsize': 0, 'incrementsize': 0, 'name': 'mqnfs01', 'networkid': '402f7a52-c906-4856-bd91-6a99bd1064af', 'created': '2020-11-19T15:28:33', 'volumetype': 'nfs', 'ostype': '', 'autoresize': False}, {'daymaxcount': 0, 'status': 'online', 'filestotal': 31129581, 'ip': '10.17.31.73', 'path': 'mqnfs02', 'id': 8309, 'description': '', 'totalsize': 1073741824000, 'cifsworkgroup': '', 'usedsize': 159744, 'scheduled': False, 'snapshottime': [], 'weekmaxcount': 0, 'removed': '', 'filesused': 96, 'maxsize': 0, 'incrementsize': 0, 'name': 'mqnfs02', 'networkid': '402f7a52-c906-4856-bd91-6a99bd1064af', 'created': '2020-11-19T16:05:35', 'volumetype': 'nfs', 'ostype': '', 'autoresize': False, 'zoneid': 'eceb5db5-6571-4696-875f-5a17949f3317', 'usageplatype': 'hourly'}, {'daymaxcount': 0, 'status': 'destroyed', 'filestotal': 31876689, 'ip': '10.17.31.73', 'path': 'mqtest1001', 'id': 8324, 'description': '', 'totalsize': 1610612736000, 'cifsworkgroup': '', 'usedsize': 147456, 'scheduled': False, 'snapshottime': ''}]}}
```

6. addCifsAccount: CIFS 계정추가 (최대 10개)

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- cifsId: CIFS의 이름
- cifsPw: CIFS의 비밀번호
- volumeId: CIFS volume ID (NAS 2.0)
- EX> python ktcloud.py nas addCifsAccount zone=KR-M2 cifsid=test1

cifsPw=tesT1234!@ volumeid=d25f785c-40e3-11eb-a00c-90e2bad1f418

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py nas addCifsAccount zone=KR-M2 cifsid=test1 cifsPw=tesT1234!@ volumeid=d25f785c-40e3-11eb-a00c-90e2bad1f418

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                    python ktcloud.py database listInstances

Input Your MSG : nas addCifsAccount ['zone=KR-M2', 'cifsid=test1', 'cifsPw=tesT1234!@', 'volumeid=d25f785c-40e3-11eb-a00c-90e2bad1f418']

[ktcloud] Result
{'addcifsaccountresponse': {'status': 'success', 'totalcount': 1, 'response': ['']}}
```

7. updateCifsAccount: CIFS 계정 변경

- zone: 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- cifsld: CIFS의 이름
- cifsPw: CIFS의 비밀번호
- EX> python ktcloud.py nas updateCifsAccount zone=KR-M2 cifsid=test1 cifsPw=tesT4321!@

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py nas updateCifsAccount zone=KR-M2 cifsid=test1 cifsPw=tesT4321!@

Loadbalancer 명령어

1. createLoadBalancer: 로드밸런서 생성

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- name: 로드밸런서 명(중복체크)
- loadbalanceroption : 로드밸런싱 옵션
(roundrobin | leastconnection|leastresponse|sourceiphash | srcipsrcport hash)
- serviceip: 서비스 ip(vip)(신규 생성시 불필요)
- serviceport: 서비스 port
- servicetype: 로드밸런서 서비스 타입(https|http| sslbridge|tcp|ftp)
- healthchecktype: Health Check 타입(http| https|tcp)
- networked: *Enterprise Security 사용자 전용,Tier 네트워크의 ID
- healthcheckurl: Health Check 타입이 HTTP/HTTPS 일 때 URL(optional)
- ciphergroupname: cipher Group Name 설정 *servicetype이 https일 때 필수
(DEFAULT/Recommend-2016-12/PCI-DSS-3.2-2016-12/2018-2Q-Cisco-REC.-
B(optional)
- sslv3: sslv3 사용 유/무 *servicetype이 https일 때 필수
(DISABLED/ENABLED)(optional)
- tlsv1: tlsv1 사용 유/무 *servicetype이 https일 때 필수
(DISABLED/ENABLED) (optional)
- tlsv11: tlsv11 사용 유/무 *servicetype이 https일 때 필수
(DISABLED/ENABLED)(optional)
- tlsv12: tlsv12 사용 유/무 *servicetype이 https일 때 필수
(DISABLED/ENABLED)(optional)
- EX> python ktcloud.py loadbalancer createLoadBalancer name=lb1227
loadbalanceroption=roundrobin serviceport=80 servicetype=http
healthchecktype=tcp zone=KR-M

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py loadbalancer createLoadBalancer name=lb1227 loadbalanceroption=roundrobin serviceport=80 servicetype=http healthchecktype=tcp zone=KR-M

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                     python ktcloud.py database listInstances

Input Your MSG : loadbalancer createLoadBalancer ['name=lb1227', 'loadbalanceroption=roundrobin', 'serviceport=80', 'servicetype=http', 'healthchecktype=tcp', 'zone=KR-M']

[ktcloud] Result
{'createLoadBalancerresponse': {'loadbalancerid': '20315', 'zoneid': '95e2f517-d64a-4866-8585-5177c256f7c7', 'zonename': 'KOR-Seoul M', 'serviceip': '211.253.14.2', 'serviceport': '80', 'name': 'lb1227', 'loadbalanceroption': 'roundrobin', 'servicetype': 'http', 'healthchecktype': 'tcp', 'healthcheckurl': ''}}
```

2. deleteLoadBalancer: 생성한 로드밸런서 삭제

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- loadbalancerid : LoadBalancer id
- EX> python ktcloud.py loadbalancer deleteLoadBalancer zone=KR-M
loadbalancerid =8432 zone=KR-M

```
C:\WCL\SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py nas updateVolume zone=KR-M id=8432 totalsize=2000

[ktcloud] ctype : server database lb gslb nas waf
[ktcloud] command : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
python ktcloud.py database listInstances

Input Your MSG : nas updateVolume ['zone=KR-M', 'id=8432', 'totalsize=2000']

[ktcloud] Result
{'updatevolumeresponse': {'status': 'success', 'response': {'daymaxcount': 0, 'status': 'online', 'filetotal': 31876689, 'ip': '10.28.122.136', 'path': 'nas_1', 'id': 8432, 'description': '', 'totalsize': 2147483648000, 'cifsworkgroup': '', 'usedsize': 270336, 'scheduled': False, 'snapshottime': [], 'weekmaxcount': 0, 'removed': '', 'filesused': 96, 'maxsize': 0, 'incrementsize': 0, 'name': 'nas1', 'networkid': '001712da-b425-4d38-aa8a-6d79b3836dd1', 'created': '2021-01-06T17:06:46', 'volumetype': 'nfs', 'ostype': '', 'autoresize': False}}}
```

3. listLoadBalancers: 생성한 로드밸런서 조회

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- loadbalancerid: LoadBalancer id(optional)
- name: 로드밸런서 명(optional)
- serviceip: 서비스 ip(vip) (optional)
- memid: 사용자 계정 ID(optional)
- loadbalancerid : LoadBalancer id(optional)
- EX> python ktcloud.py loadbalancer listLoadBalancers zone=KR-M

```
C:\WCL\SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py loadbalancer listLoadBalancers zone=KR-M

[ktcloud] ctype : server database lb gslb nas waf
[ktcloud] command : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
python ktcloud.py database listInstances

Input Your MSG : loadbalancer listLoadBalancers ['zone=KR-M']

[ktcloud] Result
{'listloadbalancersresponse': {'count': 1, 'loadbalancer': [{'certificatename': '', 'cipherGroupName': '', 'clientIpYn': '', 'establishedconn': 0, 'healthchecktype': 'tcp', 'healthcheckurl': '', 'loadbalancerid': 19871, 'loadbalanceroption': 'ROUNDROBIN', 'name': 'testlbkk2', 'networkid': '', 'requeststrate': 0, 'serviceip': '211.253.14.29', 'serviceport': 80, 'servicetype': 'tcp', 'sslv2': '', 'sslv3': '', 'state': 'DOWN', 'tag': '', 'tlsv1': '', 'tlsv11': '', 'tlsv12': '', 'zoneid': '95e2f517-d64a-4866-8585-5177c256f7c7', 'zonename': 'KOR-Seoul M']}]}}
```

4. usageLoadBalancerService: 로드밸런서 서비스의 사용량(네트워크 전송량) 조회

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)

- startdt: 시작 년월일
- enddt: 종료 년월일
- lbname: 로드밸런서명(optional)
- EX> python ktcloud.py loadbalancer usageLoadBalancerService lbname=lb1227 startdt=2020-12-01 enddt=2021-01-08 zone=KR-M

```
C:\WCLL_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py loadbalancer usageLoadBalancerService lbname=lb1227 startdt=2020-12-01 enddt=2021-01-08 zone=KR-M

[ktcloud] ctype : server database lb gslb nas waf
[ktcloud] command : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                    python ktcloud.py database listInstances

Input Your MSG : loadbalancer usageLoadBalancerService ['lbname=lb1227', 'startdt=2020-12-01', 'enddt=2021-01-08', 'zone=KR-M']

[ktcloud] Result
{'usageLoadBalancerService': {'lists': [{'date': '2021-01-07', 'name': 'lb1227', 'inbound': 0, 'outbound': 0}], 'totalinbound': 0, 'totaloutbound': 0}}
```

5. updateLoadBalancer: 생성한 로드밸런서 변경

- loadbalancerid: LoadBalancer id
- loadbalanceroption: 로드밸런싱 옵션
(roundrobin | leastconnection|leastresponse| sourceiphash | srcipsrcport hash) (optional)
- servicetype: 로드밸런서 서비스 타입(https|http| sslbridge|tcp|ftp) (optional)
- healthchecktype: Health Check 타입(http| https|tcp) (optional)
- healthcheckurl: ealth Check 타입이 HTTP/HTTPS 일 때 URL(optional)
- EX> python ktcloud.py loadbalancer usageLoadBalancerService lbname=lb1227 startdt=2020-12-01 enddt=2021-01-08 zone=KR-M

```
C:\WCLL_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py loadbalancer updateLoadBalancer loadbalancerid=20315 loadbalanceroption=leastconnection zone=KR-M

[ktcloud] ctype : server database lb gslb nas waf
[ktcloud] command : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                    python ktcloud.py database listInstances

Input Your MSG : loadbalancer updateLoadBalancer ['loadbalancerid=20315', 'loadbalanceroption=leastconnection', 'zone=KR-M']

[ktcloud] Result
{'updateLoadBalancer': {'loadbalancerid': 20315, 'zoneid': '95e2f517-d64a-4866-8585-5177c256f7c7', 'zonename': 'KOR-Seoul M', 'serviceip': '211.253.14.2', 'serviceport': '80', 'name': 'lb1227', 'loadbalanceroption': 'LEASTCONNECTION', 'servicetype': 'http', 'healthcheckurl': ''}}
```

6. checkLoadBalancerName: 로드밸런서명의 중복체크

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)

- name : 로드밸런서 명(optional)
- EX> python ktcloud.py loadbalancer checkLoadBalancerName name= testlbkk2 zone=KR-M

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py loadbalancer checkLoadBalancerName name=testlbkk2 zone=KR-M

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances

Input Your MSG : loadbalancer checkLoadBalancerName ['name=testlbkk2', 'zone=KR-M']

[ktcloud] Result
{'checkloadbalancernameresponse': {'text': '중복', 'success': 'false'}}
```

7. addLoadBalancerWebServer : 로드밸런서의 대상이 될 웹 서버 추가

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- loadbalancerid : LoadBalancer id
- virtualmachineid: 웹서버 id
- ipaddress: 웹서버가 사용 할 public ip
- publicport: 웹서버가 사용 할 public port
- EX> python ktcloud.py loadbalancer addLoadBalancerWebServer loadbalancerid=19871 virtualmachineid=a706200e-fb27-46ae-9847-0343cb321d57 ipaddress=211.253.8.82 publicport=20001 zone=KR-M

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py loadbalancer addLoadBalancerWebServer loadbalancerid=19871 virtualmachineid=a706200e-fb27-46ae-9847-0343cb321d57 ipaddress=211.253.8.82 publicport=20001 zone=KR-M

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances

Input Your MSG : loadbalancer addLoadBalancerWebServer ['loadbalancerid=19871', 'virtualmachineid=a706200e-fb27-46ae-9847-0343cb321d57', 'ipaddress=211.253.8.82', 'publicport=20001', 'zone=KR-M']

[ktcloud] Result
{'addloadbalancerwebserverresponse': {'serviceid': '190495', 'loadbalancerid': '19871', 'virtualmachineid': 'a706200e-fb27-46ae-9847-0343cb321d57', 'ipaddress': '211.253.8.82', 'publicport': '20001', 'weight': ''}}
```

8. listLoadBalancerWebServer : 로드밸런서에 등록된 웹 서버의 정보 조회

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- loadbalancerid : LoadBalancer id
- EX> python ktcloud.py loadbalancer listLoadBalancerWebServers loadbalancerid= 19871 zone=KR-M

```
C:\WCL\SDK\WKT-Cloud-Toolkit-main (1)WKT-Cloud-Toolkit-main>python ktcloud.py loadbalancer listLoadBalancerWebServers loadbalancerid=19871 zone=KR-M

[ktcloud] ctype : server database lb gslb nas waf
[ktcloud] command : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                  python ktcloud.py database listInstances

Input Your MSG : loadbalancer listLoadBalancerWebServers ['loadbalancerid=19871', 'zone=KR-M']

[ktcloud] Result
{'listloadbalancerwebserverresponse': {'count': 1, 'loadbalancerwebserver': [{'avgsvrttfb': '0', 'cursrvrconnections': '0', 'ipaddress': '211.253.8.82', 'loadbalancerid': 19871, 'publicport': '20001', 'requeststrate': '0', 'serviceid': 190495, 'state': 'DOWN', 'throughputrate': '0', 'virtualmachineid': 'a706200e-fb27-46ae-9847-0343cb321d57', 'weight': ''}]}}
```

9. removeLoadBalancerWebServer: 로드밸런서에 등록된 웹 서버의 정보 삭제

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- serviceid : Service id
- EX> python ktcloud.py loadbalancer removeLoadBalancerWebServer serviceid=190495 zone=KR-M

```
C:\WCL\SDK\WKT-Cloud-Toolkit-main (1)WKT-Cloud-Toolkit-main>python ktcloud.py loadbalancer removeLoadBalancerWebServer serviceid=190495 zone=KR-M

[ktcloud] ctype : server database lb gslb nas waf
[ktcloud] command : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                  python ktcloud.py database listInstances

Input Your MSG : loadbalancer removeLoadBalancerWebServer ['serviceid=190495', 'zone=KR-M']

[ktcloud] Result
{'removeloadbalancerwebserverresponse': {'success': True, 'displaytext': 'testlbkk2_211.253.8.82_20001 webserver is deleted.'}}
```

10. createTag: 로드밸런서에 Tag 생성(로드밸런서 당 1개)

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- loadbalancerid: Loadbalancer id
- tag: LoadBalancer 에 등록 할 Tag 내용
- EX> python ktcloud.py loadbalancer createTag loadbalancerid=19871 tag=test zone=KR-M

```
C:\WCL\SDK\WKT-Cloud-Toolkit-main (1)WKT-Cloud-Toolkit-main>python ktcloud.py loadbalancer createTag loadbalancerid=19871 tag=test zone=KR-M

[ktcloud] ctype : server database lb gslb nas waf
[ktcloud] command : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                  python ktcloud.py database listInstances

Input Your MSG : loadbalancer createTag ['loadbalancerid=19871', 'tag=test', 'zone=KR-M']

[ktcloud] Result
{'createtagresponse': {'displaytext': '성공', 'Success': 'true'}}
```

11. deleteTag: 로드밸런서에 Tag 삭제

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- loadbalancerid: Loadbalancer id

- EX> python ktcloud.py loadbalancer deleteTag loadbalancerid=19871 zone=KR-M

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py loadbalancer deleteTag loadbalancerid=19871 zone=KR-M
```

```
[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api\_prologue-intro\_api\_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      : python ktcloud.py database listInstances
```

```
Input Your MSG : loadbalancer deleteTag ['loadbalancerid=19871', 'zone=KR-M']
```

```
[ktcloud] Result
{'deletetagresponse': {'displaytext': '성공', 'Success': 'true'}}
```

GSLB 명령어

1. addGslbServer: Gslb 신규 생성

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- svrNm: GSLB name
- domainNm : Domain(CNAME) 정보
* 유의사항: 파라미터 작성 시 도메인 명 뒤에 (.g.ucloudbiz.com)을 반드시 포함하여 작성하여야 합니다.
- persistence: ttl 만료 후 해당 도메인에 대해 동일한 IP 정보를 제공하는 기능의 사용여부(none / use)
- ttl: GSLB 제공정보를 질의 DNS 가 보유하는 시간 (30/60/900/1800/3600, 기본값은 30)
- EX> python ktcloud.py gslb addGslbServer svrNm=gslb2 domainNm=tst.g.ucloudbiz.com persistence=use ttl=30 zone=KR-M

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)WKT-Cloud-Toolkit-main>python ktcloud.py gslb addGslbServer svrNm=gslb2 domainNm=tst.g.ucloudbiz.com p
ersistence=use ttl=30 zone=KR-M

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                    : python ktcloud.py database listInstances

Input Your MSG :  gslb addGslbServer ['svrNm=gslb2', 'domainNm=tst.g.ucloudbiz.com', 'persistence=use', 'ttl=30', 'zone=KR-M']

[ktcloud] Result
{'addGslbServerresponse': {'success': 'true', 'displaytext': 'gslb server add.'}}
```

2. checkGslbName: GSLB 이름의 중복체크

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- name: GSLB name
- EX> python ktcloud.py gslb checkGslbName name=gslb2 zone=KR-M

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)WKT-Cloud-Toolkit-main>python ktcloud.py gslb checkGslbName name=gslb2 zone=KR-M

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                    : python ktcloud.py database listInstances

Input Your MSG :  gslb checkGslbName ['name=gslb2', 'zone=KR-M']

[ktcloud] Result
{'checkGslbNameresponse': {'success': 'false', 'text': '중복'}}
```

3. addGslbService: 특정 GSLB 에 사용될 서비스(IP) 정보 추가

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)

- svrNm: GSLB name
- ip: 서비스 IP 주소
- port: 서비스 Port 정보
- opType: 서비스 동작(active / backup)
- healthCheckType: 모니터링방식(TCP / HTTP)
- EX> python ktcloud.py gslb addGslbService svrNm=gslb2 ip=10.10.10.10 port=80 opType=active healthCheckType=tcp zone=KR-M

```
C:\WCL\SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py gslb addGslbService svrNm=gslb2 ip=10.10.10.10 port=80 opType=active healthCheckType=tcp zone=KR-M

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                     : python ktcloud.py database listInstances

Input Your MSG :  gslb addGslbService ['svrNm=gslb2', 'ip=10.10.10.10', 'port=80', 'opType=active', 'healthCheckType=tcp', 'zone=KR-M']

[ktcloud] Result
{'addgslbservice': {'success': 'true', 'displaytext': 'gslbservice add.'}}
```

4. listGslbServer: GSLB 리스트 정보 조회

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- EX> python ktcloud.py gslb listGslbServer zone=KR-M

```
C:\WCL\SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py gslb listGslbServer zone=KR-M

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                     : python ktcloud.py database listInstances

Input Your MSG :  gslb listGslbServer ['zone=KR-M']

[ktcloud] Result
{'listgslbserverresponse': {'lists': [{'persistype': 'N', 'domainnm': 'ktcloud.shop.g.ucloudbiz.com', 'svrnm': 'cloudShop', 'ttl': 30}, {'persistype': 'N', 'domainnm': 'ktcloud.shop.g.ucloudbiz.com', 'svrnm': 'cloudShop_bkup', 'ttl': 30}, {'persistype': 'N', 'domainnm': 'gslbfunctiontest.io.g.ucloudbiz.com', 'svrnm': 'gslbfunctiontest', 'ttl': 30}, {'persistype': 'N', 'domainnm': 'gslbfunctiontest.io.g.ucloudbiz.com', 'svrnm': 'gslbfunctiontest_bkup', 'ttl': 30}, {'persistype': 'N', 'domainnm': 'example1.com.g.ucloudbiz.com', 'svrnm': 'testtest', 'ttl': 30}, {'persistype': 'N', 'domainnm': 'example1.com.g.ucloudbiz.com', 'svrnm': 'testtest_bkup', 'ttl': 30}, {'persistype': 'Y', 'domainnm': 'tst.g.ucloudbiz.com', 'svrnm': 'gslb2', 'ttl': 30}, {'persistype': 'Y', 'domainnm': 'tst.g.ucloudbiz.com', 'svrnm': 'gslb2_bkup', 'ttl': 30}]}}
```

5. listGslbService: 특정 GSLB 에 사용되고 있는 서비스(IP)의 리스트 조회

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- svrNm : GSLB Name
- EX> python ktcloud.py gslb listGslbService svrNm=gslb2 zone=KR-M

```

C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py gslb listGslbService svrNm=gslb2 zone=KR-M
[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances
-----
Input Your MSG : gslb listGslbService ['svrNm=gslb2', 'zone=KR-M']
-----
[ktcloud] Result
{'listgslbservice': {'lists': [{'svrnm': 'gslb2', 'ip': '10.10.10.10', 'port': '80', 'healthchecktype': 'TCP', 'optype': 'ACTIVE',
'weight': '1'}]}}
```

6. deleteGslbService: 특정 GSLB 에 사용되고 있는 서비스(IP) 삭제

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- gslbsvcIpName: 대상 GSLB, 서비스 IP, Port 정보의 조합. backup 으로 동작 시 조합 뒤에 '_bkup' 을 추가
- EX> python ktcloud.py gslb deleteGslbService gslbsvcIpName=gslb2_10.10.10.10_80 zone=KR-M

```

C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py gslb deleteGslbService gslbsvcIpName=gslb2_10.10.10.10_80 zone=KR-M
[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances
-----
Input Your MSG : gslb deleteGslbService ['gslbsvcIpName=gslb2_10.10.10.10_80', 'zone=KR-M']
-----
[ktcloud] Result
{'deletegslbservice': {'success': 'true', 'displaytext': 'gslbservice delete.'}}
```

7. deleteGslbServer: 특정 GSLB 서버 삭제

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- svrNm: GSLB name
- EX> python ktcloud.py gslb deleteGslbServer svrNm=gslb2 zone=KR-M

```

C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py gslb deleteGslbServer svrNm=gslb2 zone=KR-M
[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances
-----
Input Your MSG : gslb deleteGslbServer ['svrNm=gslb2', 'zone=KR-M']
-----
[ktcloud] Result
{'deletegslbserver': {'success': 'true', 'displaytext': 'GslbServer deleted.'}}
```

WAF 명령어

1. createWAF: 웹방화벽 생성

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- name: WAF 이름
- type: 구성(single, dual)
- spec: 사양(standard, advanced, premium)
- waf1consoleport: WAF1 VM console 접속 port (5950~5999)
- waf1sshport: WAF1 VM ssh 접속 port (5950~5999)
- waf1dbport: WAF1 VM DB 접속 port (5950~5999)
- waf2consoleport: WAF2 VM console 접속 port (5950~5999)(optional)
- waf2sshport: WAF2 VM ssh 접속 port (5950~5999)(optional)
- waf2dbport: WAF2 VM DB 접속 port (5950~5999)(optional)
- loadbalanceroption: 로드밸런스 옵션(roundrobin | leastconnection | leastresponse | sourceiphash | srcipsrcporthash)(optional)
- loadbalancerport: MPX 가 로드밸런싱을 담당해야 하는 로드밸런싱 Port 입력 (optional)
- healthchecktype: Health Check 타입(http | https | tcp)(optional)
- healthcheckurl: Health Check 타입이 HTTP/HTTPS 일 때 URL(optional)
- EX> python ktcloud.py waf createWAF name=waf1227 type=single spec=standard waf1consoleport=5950 waf1sshport=5951 waf1dbport=5952 zone=KR-M

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1) WKT-Cloud-Toolkit-main>python ktcloud.py waf createWAF name=waf1227 type=single spec=standard waf1consoleport=5950 waf1sshport=5951 waf1dbport=5952 zone=KR-M

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref, https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                        python ktcloud.py database listInstances

Input Your MSG : waf createWAF ['name=waf1227', 'type=single', 'spec=standard', 'waf1consoleport=5950', 'waf1sshport=5951', 'waf1dbport=5952', 'zone=KR-M']

[ktcloud] Result
{'createwafresponse': {'id': 3103, 'name': 'waf1227', 'type': 'single', 'spec': 'standard', 'zoneid': '95e2f517-d64a-4866-8585-5177c256f7c7', 'zonename': 'KOR-Seoul M', 'jobid1': 'fclb278b-5ac2-4453-a131-93a1ad812643', 'jobid2': '', 'waf1consoleport': '5950', 'waf1sshport': '5951', 'waf1dbport': '5952', 'waf2consoleport': '', 'waf2sshport': '', 'waf2dbport': '', 'loadbalanceoption': '', 'serviceip': '211.253.8.82', 'serviceport': '', 'active': 'false'}}
```

2. addWAFWebServer: 보안 서비스의 대상이 될 웹 서버 추가

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)

- id: WAF id
- virtualmachineid: Virtualmachine id
- webserverport: 웹서버의 서비스 port
- proxyport1: RVM -> WAF VM1 연결 port
- proxyport2: (dual 상품인 경우) RVM -> WAF VM2 연결 port(optional)
- sslmode: disabled | sslthru | sslterm
- loadbalancerid: (single 상품인 경우) RVM -> LB 연결 loadbalancer id(optional)
- EX> python ktcloud.py waf addWAFWebServer id=3103 virtualmachineid=a706200e-fb27-46ae-9847-0343cb321d57 webserverport=80 proxyport1=6000 sslmode=disabled zone=KR-M

```
C:\WCL\SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py waf addWAFWebServer id=3103 virtualmachineid=a706200e-fb27-46ae-9847-0343cb321d57 webserverport=80 proxyport1=6000 sslmode=disabled zone=KR-M

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                        python ktcloud.py database listInstances

Input Your MSG : waf addWAFWebServer ['id=3103', 'virtualmachineid=a706200e-fb27-46ae-9847-0343cb321d57', 'webserverport=80', 'proxyport1=6000', 'sslmode=disabled', 'zone=KR-M']

[ktcloud] Result
{'addwafwebserverresponse': {'id': 3103, 'zoneid': '95e2f517-d64a-4866-8585-5177c256f7c7', 'zonename': 'KOR-Seoul M', 'webserverid': 8787, 'virtualmachineid': 'a706200e-fb27-46ae-9847-0343cb321d57', 'webserverport': '80', 'proxyport1': '6000', 'proxyport2': None, 'sslmode': 'disabled'}}
```

3. addWAFWebSite: 보안 서비스의 대상이 될 웹 사이트 추가

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- id: WAF id
- sitename: 사이트명 or IP
- port: 서비스 port
- policynum: 보안정책 {0|1|2|3}
표준 보안정책, 기본 보안 정책, 탐지만하고 차단 안함, 탐지 없이 통과
- EX> python ktcloud.py waf addWAFWebSite id=3103 sitename=cs.ucloud.com
port=80 policynum=0 zone=KR-M

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py waf addWAFWebSite id=3103 sitename=cs.ucloud.com port=80 policynum=0 zone=KR-M

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                     : python ktcloud.py database listInstances

Input Your MSG : waf addWAFWebSite ['id=3103', 'sitename=cs.ucloud.com', 'port=80', 'policynum=0', 'zone=KR-M']

[ktcloud] Result
{'addwafwebsiteresponse': {'wafid': '67d4fd9b-0d63-4c87-95d3-acf739cb84d5', 'zoneid': '95e2f517-d64a-4866-8585-5177c256f7c7', 'zonename': 'KOR-Seoul M', 'websiteresourceid': 7656, 'sitename': 'cs.ucloud.com', 'port': '80', 'policynum': '0'}}
```

4. listWAFs: 생성한 웹방화벽 목록

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- id: WAF id(optional)
- name: WAF 이름(optional)(optional)
- type: 구성(single, dual)(optional)
- spec: 사양(basic, standard, advanced, premium)(optional)
- EX> python ktcloud.py waf listWAFs zone=KR-M

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py waf listWAFs zone=KR-M

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                     : python ktcloud.py database listInstances

Input Your MSG : waf listWAFs ['zone=KR-M']

[ktcloud] Result
{'listwafsresponse': {'count': 2, 'wafservice': [{'active': 'true', 'healthchecktype': '', 'healthcheckurl': '', 'id': '3072', 'loadbalanceoption': '', 'loadbalancerid': '', 'name': 'testwaf123', 'serviceip': '', 'serviceport': '', 'spec': 'standard', 'type': 'single', 'zoneid': '95e2f517-d64a-4866-8585-5177c256f7c7', 'zonename': 'KOR-Seoul M', 'consoleport1': '5997', 'consoleport2': '', 'apiport1': '5998', 'apiport2': '', 'sshport1': '5999', 'sshport2': ''}, {'active': 'true', 'healthchecktype': '', 'healthcheckurl': '', 'id': '3103', 'loadbalanceoption': '', 'loadbalancerid': '', 'name': 'waf1227', 'serviceip': '', 'serviceport': '', 'spec': 'standard', 'type': 'single', 'zoneid': '95e2f517-d64a-4866-8585-5177c256f7c7', 'zonename': 'KOR-Seoul M', 'consoleport1': '5952', 'consoleport2': '', 'apiport1': '5950', 'apiport2': '', 'sshport1': '5951', 'sshport2': ''}]}}
```

5. listWAFWebServers: 보안 서비스의 대상이 될 웹 서버의 정보 조회

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- id: WAF id
- webserverresourceid: WebServerResource id(optional)
- EX> python ktcloud.py waf listWAFWebServers id=3103 zone=KR-M

```

C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)WKT-Cloud-Toolkit-main>python ktcloud.py waf listWAFWebServers id=3103 zone=KR-M

zone=KR-M

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py waf removeWAFWebServer id=3103 webserverid=8787 zone=KR-M

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances

Input Your MSG : waf removeWAFWebServer ['id=3103', 'webserverid=8787', 'zone=KR-M']

[ktcloud] Result
{'removewafwebserverresponse': {'success': 'true', 'displaytext': 'webserver(8787) is removed.'}}
```

9. deleteWAF: 생성한 웹방화벽 삭제

- zone : 존 이름(KR-M, KR-M2, KR-CA, KR-CB)
- id: WAF id
- EX> python ktcloud.py waf deleteWAF id=3103 zone=KR-M

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py waf deleteWAF id=3103 zone=KR-M

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances

Input Your MSG : waf deleteWAF ['id=3103', 'zone=KR-M']

[ktcloud] Result
{'deletewafresponse': {'success': 'true', 'displaytext': 'waf(waf1227) is removed.'}}
```

Database 명령어

1. createInstance: 새로운 인스턴스 생성

- `instancetype`: 인스턴스의 이름, 새로 생성할 인스턴스에 부여할 인스턴스 이름 유효값 : 1 ~ 256자의 영문자, 숫자를 포함한 문자
- `storagesize`: 스토리지 용량 (유효한 값은 최소 10 gigabytes 부터 최대 300 gigabytes까지 10 gigabytes 단위로 사용가능)
- `perfclass`: 성능 클래스 인스턴스에 할당할 가상 CPU의 수와 메모리 용량을 명시 (코어 갯수 X 메모리 용량 (gigabytes))
- `maintenanceweekday`: 유지 보수 일정의 요일을 설정한다. 유지 보수 일정에서 설정하는 시간은 모두 한국표준시 (KST)를 기준으로 한다.
유지 보수 일정은 (요일, 시작 시, 시작 분, 유지 보수 기간)으로 정의된다.
유지 보수는 매주 1회 수행되며, 서비스가 수행되는 날짜는 매주 특정 요일로 지정된다.
유지 보수 날짜가 되면 (시작 시, 시작 분) ~ (시작 시 + 유지 보수 기간, 시작 분) 사이의 시간에 유지 보수 작업이 수행된다.
예를 들어 유지 보수 실행 요일을 thu, 시작 시를 23, 시작 분을 20, 유지 보수 기간을 4로 하면 매주마다 목요일 23:20 ~ 금요일 3:20까지 유지 보수 작업이 수행된다.(유효값: sun | mon | tue | wed | thu | fri | sat)
- `parametergroupid`: 인스턴스가 사용하는 파라미터 그룹의 식별자 (유효값 : `dbengineversion` 과 맞는 파라미터 그룹을 지정해야 한다)
- `dbmastername`: 데이터베이스 마스터 계정의 이름(1~16자 길이의 영문자와 숫자를 포함하는 문자열)
- `dbmasterpassword`: 데이터베이스 마스터 계정의 암호(4~15자 길이의 영문자와 숫자를 포함하는 문자열)
- `dbname`: 인스턴스 생성시 같이 생성할 데이터베이스의 이름(1~64자 길이의 영문자와 숫자를 포함하는 문자열)
- `dbengineversion`: MySQL 버전
- `usageplantype`: 약정 정보 (유효값: monthly(무약정-월 단위 요금), hourly(시간요금))
- `zone`: 존 인스턴스를 생성할 존을 명시한다 (kr-0 | kr-1 | kr-2 | kr-3 | kr-m2 | jp-1 | usw-0)
- `backupretention`: 백업본 보관일(Day)(기본값:0, 유효값:0~7)(optional)
- `backupstarthour`: 일간 (Daily) 백업 일정 시작 시간(Hour) (기본값:0, 유효

값:0~23)(optional)

- backupstartmin: 일간 백업 시작 분(Minute) (기본값:0, 유효값:0~59)(optional)
- backupduration: 일간 백업 스케줄링 기간(Hour)(기본값:2, 유효값:2~8)(optional)
- maintenancestarthour: 유지 보수 시작 시(Hour) (기본값:0, 유효값:0~23)(optional)
- maintenancestartmin: 유지 보수 시작 분(Minute) (기본값:0, 유효값:0~59)(optional)
- maintenanceduration: 유지 보수 기간 (Hour)(기본값:4, 유효값:4~8))(optional)
- accesscontrolgroupids: 인스턴스가 사용할 접근 제어 그룹의 식별자(들)(인자가 다수 일 경우에는 ', '로 분리))(optional)
- storageType: 스토리지 유형, 스토리지 유형을 설정한다.
유효값(D: 일반 디스크(기본값), SD: SSD 디스크(Seoul-M2 zone 가능), S: SSD-provisioned)(optional)
- iops: 디스크의 IOPS값, SSD-provisioned의 IOPS값을 설정한다. storageType이 S(SSD-provisioned)인 경우에만 유효하다. 유효값 6000~20000 사이의 값(1000단 위)(optional)
- EX> python ktcloud.py database createInstance instanceName=cwstest
storageSize=50 perfClass=1x1 maintenanceWeekday=mon parameterGroupId=21

torageSize=50 perfClass=1x1 maintenanceWeekday=mon parameterGroupId=21 dbMasterName=cws dbMasterPassword=test123 dbName=tes
t dbEngineVersion=5.6.24 usagePlanType=monthly zone=kr-0

[ktcloud] cType      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < cType > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances

Input Your MSG : database createInstance ['instanceName=cwstest', 'storageSize=50', 'perfClass=1x1', 'maintenanceWeekday=m
on', 'parameterGroupId=21', 'dbMasterName=cws', 'dbMasterPassword=test123', 'dbName=test', 'dbEngineVersion=5.6.24', 'usage
PlanType=monthly', 'zone=kr-0']

[ktcloud] Result
{'createInstanceResponse': {'jobid': 'ee5d6c98-63fe-46dd-8627-1013c52c3554', 'instanceid': 'c36b83a6-9b3f-4c7b-a6eb-d386d83
def26', 'instanceStatus': 'Creating'}}
```

2. listInstances: 인스턴스의 정보 조회

- instanceids: 인스턴스의 식별자(들).
정보 조회 대상이 되는 인스턴스(들)의 식별자이다.
해당 파라미터의 값이 없을 경우에는 현재 사용자가 소유하고 있는 모든 인스턴스의 정보를 볼 수 있다.
타입 : String, 인자가 다수 일 경우에는 ','로 분리하여 전달한다.(optional)
- EX> python ktcloud.py database listInstances

```
C:\WCL\SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py nas listVolumes

[ktcloud] ctype       : server database lb gslb nas waf
[ktcloud] command     : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage       : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example     : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                       python ktcloud.py database listInstances

Input Your MSG : nas listVolumes []

[ktcloud] Result
{'listvolumesresponse': {'status': 'success', 'count': 43, 'response': [{'daymaxcount': 0, 'status': 'destroyed', 'filestotal': 31129581, 'ip': '10.17.31.73', 'path': 'mnfs01', 'id': 8308, 'description': '', 'totalsize': 1073741824000, 'cifsworkgroup': '', 'usedsize': 147456, 'scheduled': False, 'snapshottime': [], 'weekmaxcount': 0, 'removed': '2020-11-19T15:58:34', 'filesused': 96, 'maxsize': 0, 'incrementsize': 0, 'name': 'mnfs01', 'networkid': '402f7a52-c906-4856-bd91-6a99bd1064af', 'created': '2020-11-19T15:28:33', 'volumetype': 'nfs', 'ostype': '', 'autoresize': False}, {'daymaxcount': 0, 'status': 'online', 'filestotal': 31129581, 'ip': '10.17.31.73', 'path': 'mnfs02', 'id': 8309, 'description': '', 'totalsize': 1073741824000, 'cifsworkgroup': '', 'usedsize': 159744, 'scheduled': False, 'snapshottime': [], 'weekmaxcount': 0, 'removed': '2020-11-19T16:05:35', 'filesused': 96, 'maxsize': 0, 'incrementsize': 0, 'name': 'mnfs02', 'networkid': '402f7a52-c906-4856-bd91-6a99bd1064af', 'created': '2020-11-19T16:05:35', 'volumetype': 'nfs', 'ostype': '', 'autoresize': False}]}}
```

3. updateInstancePerfClass: 인스턴스의 성능 클래스 속성 변경

- instanceid: 인스턴스의 식별자 (속성 변경의 대상이 되는 인스턴스를 지정한다.)
- perfclass: 성능 클래스 (코어 갯수 X 메모리 용량 (gigabytes))
- EX> python ktcloud.py database updateInstancePerfClass instanceid=c36b83a6-9b3f-4c7b-a6eb-d386d83def26 perfclass=1x2

```

```

5. updateInstanceBackup: 인스턴스의 백업 설정 변경

- instanceid: 인스턴스의 식별자 (속성 변경의 대상이 되는 인스턴스를 지정한다.) (optional)
- backupretention: 백업본 보관일(Day)
상세한 설명은 createInstance의 Request Parameters를 참조한다.
백업이 꺼진 상태에서 백업을 켜는 경우에 backupstarthour, backupstartmin, backupduration 등을 새로 입력되지 않으면 백업을 끄기 이전에 설정된 값으로 백업 기능이 동작하게 된다. 이전에 설정된 값은 백업이 꺼진 경우에도 listInstances를 통해 확인할 수 있다. (optional)
- backupstarthour: 일간 (Daily) 백업 일정 시작 시간(Hour) (기본값:0, 유효값:0~23)
상세한 설명은 createInstance의 Request Parameters를 참조한다. (optional)
- Backupstartmin: 일간 백업 시작 분(Minute) (기본값:0, 유효값:0~59)
상세한 설명은 createInstance의 Request Parameters를 참조한다. (optional)
- Backupduration: 일간 백업 스케줄링 기간(Hour)(기본값:2, 유효값:2~8)
상세한 설명은 createInstance의 Request Parameters를 참조한다. (optional)
- EX> python ktcloud.py database updateInstanceBackup instanceid=c36b83a6-9b3f-4c7b-a6eb-d386d83def26 backupretention=2

```
C:\WCL\SDK\WKT-Cloud-Toolkit-main (1)\WKT-Cloud-Toolkit-main>python ktcloud.py database updateInstanceBackup instanceid=c36b83a6-9b3f-4c7b-a6eb-d386d83def26 backupretention=2

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro

```

20. createReplicationGroupMultiZone: 원격 존에 하나의 슬레이브 인스턴스를 갖는 복제 그룹 생성

- instancename: 인스턴스의 이름
새로 생성할 마스터 인스턴스에 부여할 인스턴스 이름이다.
이름은 사용자가 소유하고 있는 인스턴스 내에서 유일해야 하므로, 기존에 사용자가 소유한 인스턴스와는 다른 이름을 지정해야 한다.
원격 존 슬레이브 인스턴스의 이름은 rep1_of_instancename으로 자동 적용된다.
유효값 : 1 ~ 256자의 영문자, 숫자를 포함한 문자열
- storagesize: 스토리지 용량 마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다.
- perfclass: 성능 클래스마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다.

- `maintenanceweekday`: 유지 보수 실행 요일 (Weekday)마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 `createInstance` 의 Request Parameters를 참조한다.
- `parametergroupid`: 인스턴스가 사용하는 파라미터 그룹의 식별자마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 `createInstance`의 Request Parameters를 참조한다.
- `dbmastername`: 데이터베이스 마스터 계정의 이름 상세한 설명은 `createInstance` 의 Request Parameters를 참조한다.
- `dbmasterpassword`: 데이터베이스 마스터 계정의 암호 상세한 설명은 `createInstance` 의 Request Parameters를 참조한다.
- `dbname`: 인스턴스 생성시 같이 생성할 데이터베이스의 이름 상세한 설명은 `createInstance` 의 Request Parameters를 참조한다.
- `dbengineversion`: MySQL 버전마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 `createInstance` 의 Request Parameters를 참조한다.
- `mainzone`: 기본 존의 이름 복제 마스터와 복제 슬레이브 (원격존 복제 슬레이브는 제외)가 생성되는 기본 존을 지정한다.
유효값 : 서비스에 미리 정의된 값들 (1.4항 참조)
- `remotezone`: 원격 존의 이름 원격존 복제 슬레이브가 생성되는 존을 지정한다.
유효값 : 서비스에 미리 정의된 값들 (1.4항 참조)
- `usageplantype`: 약정 정보 상세한 설명은 `createInstance` 의 Request Parameters를 참조한다.
- `backupretention`: 백업본 보관일 (Day)마스터 인스턴스의 백업을 설정한다.
상세한 설명은 `createInstance` 의 Request Parameters를 참조한다. (optional)
- `backupstarthour`: 일간 (Daily) 백업 일정 시작 시 (Hour) 마스터 인스턴스의 백업을 설정한다.
상세한 설명은 `createInstance` 의 Request Parameters를 참조한다. (optional)
- `backupstartmin`: 일간 백업 시작 분 (Minute)마스터 인스턴스의 백업을 설정한다.
상세한 설명은 `createInstance` 의 Request Parameters를 참조한다. (optional)
- `backupduration`: 일간 백업 스케줄링 기간 (Hour)마스터 인스턴스의 백업을 설정한다.
상세한 설명은 `createInstance` 의 Request Parameters를 참조한다. (optional)
- `maintenancestarthour`: 유지 보수 시작 시 (Hour)마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 `createInstance` 의 Request Parameters를 참조한다. (optional)

- maintenancestartmin: 유지 보수 시작 분 (Minute)마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다. (optional)
- maintenanceduration: 유지 보수 기간 (Hour)마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다. (optional)
- accesscontrolgroupids: MySQL 버전마스터와 원격존 슬레이브 인스턴스에 적용된다.
인스턴스가 사용할 접근 제어 그룹의 식별자(들)마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다. (optional)
- storageType: 스토리지 유형 스토리지 유형을 설정한다.
유효값(D : 일반 디스크(기본값), SD : SSD 디스크(Seoul-M2 zone만 가능), S : SSD-provisioned) (optional)
- iops: 디스크의 IOPS값
SSD-provisioned의 IOPS값을 설정한다.
storageType이 S(SSD-provisioned)인 경우에만 유효하다.
유효값 6000 ~ 20000 사이의 값(1000단위)(optional)

```

24. createHaGroup: Single 상태의 인스턴스를 대상으로 HA Group 생성

- instanceid: HA 구성의 대상이 되는 인스턴스를 지정한다.
HA Group은 대상 인스턴스를 마스터로 지정하고 이를 복제함으로써 그룹의 형태를 갖게된다.
본 매개변수는 그 인스턴스를 지정하는 식별자이다.
- slavecount: 그룹크기의 한계는 RDBaaS의 구조에 따라 1개까지로 한정한다.
(유효값 : 0 ~ 1)
- hamode: HA Group 내 자동 절체 모드 설정(유효값 : Y or N)
- semisync: HA Group 내 SEMI-SYNC 관련 설정(유효값 : Y or N)
- hagroupname: 사용할 HA Group 명을 설정한다.(사용 가능한 특수 기호 : !@*)
- EX> python ktcloud.py database createHaGroup hagroupname=testha01 hamode=Y

[ktcloud] Result
{'createhagroupresponse': {'jobid': '89b041cb-ba89-4a39-95e1-a69e08d02556', 'hagroupid': '197c3448-ab4a-4bb9-86db-c5de8e79544f', 'memberjobcount': '1', 'memberjoblist': [{'memberjob': [{'jobid': '6b31d357-a85c-4d88-beea-c4ef3e3721b9', 'instanceid': 'e67152a9-579e-4b43-ac14-dc3c65684c0e'}]}]}}
```

25. createHaGroupSingleZone: 단일 존에 하나의 HA Group 생성

- instancename: 인스턴스의 이름
새로 생성할 마스터 인스턴스에 부여할 인스턴스 이름이다.
이름은 사용자가 소유하고 있는 인스턴스 내에서 유일해야 하므로, 기존에 사용자가 소유한 인스턴스와는 다른 이름을 지정해야 한다.
원격 존 슬레이브 인스턴스의 이름은 rep1_of_instancename으로 자동 적용된다.
유효값 : 1 ~ 256자의 영문자, 숫자를 포함한 문자열

- storageSize: 스토리지 용량 마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다.
- perfclass: 성능 클래스마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다.
- maintenanceweekday: 유지 보수 실행 요일 (Weekday)마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다.
- parametergroupid: 인스턴스가 사용하는 파라미터 그룹의 식별자마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 createInstance의 Request Parameters를 참조한다.
- dbmastername: 데이터베이스 마스터 계정의 이름 상세한 설명은 createInstance 의 Request Parameters를 참조한다.
- dbmasterpassword: 데이터베이스 마스터 계정의 암호 상세한 설명은 createInstance 의 Request Parameters를 참조한다.
- dbname: 인스턴스 생성시 같이 생성할 데이터베이스의 이름 상세한 설명은 createInstance 의 Request Parameters를 참조한다.
- dbengineversion: MySQL 버전마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다.
- mainzone: 기본 존의 이름 복제 마스터와 복제 슬레이브 (원격존 복제 슬레이브는 제외)가 생성되는 기본 존을 지정한다.
유효값 : 서비스에 미리 정의된 값들 (1.4항 참조)
- remotezone: 원격 존의 이름 원격존 복제 슬레이브가 생성되는 존을 지정한다.
유효값 : 서비스에 미리 정의된 값들 (1.4항 참조)
- hamode: HA Group 내 자동 절체 모드 설정(유효값 : Y or N)
- semisync: HA Group 내 SEMI-SYNC 관련 설정, hamode=Y일 경우 Y로 설정할 수 없다.(유효값 : Y or N)
- hagroupname: 사용할 HA Group 명을 설정한다. 사용 가능한 특수 기호 : !@*
- usageplantype: 약정 정보 상세한 설명은 createInstance 의 Request Parameters를 참조한다.
- backupretention: 백업본 보관일 (Day)마스터 인스턴스의 백업을 설정한다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다. (optional)
- backupstarthour: 일간 (Daily) 백업 일정 시작 시 (Hour) 마스터 인스턴스의 백업을 설정한다.

상세한 설명은 createInstance 의 Request Parameters를 참조한다. (optional)

- backupstartmin: 일간 백업 시작 분 (Minute)마스터 인스턴스의 백업을 설정한다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다. (optional)
- backupduration: 일간 백업 스케줄링 기간 (Hour)마스터 인스턴스의 백업을 설정한다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다. (optional)
- maintenancestarthour: 유지 보수 시작 시 (Hour)마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다. (optional)
- maintenancestartmin: 유지 보수 시작 분 (Minute)마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다. (optional)
- maintenanceduration: 유지 보수 기간 (Hour)마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다. (optional)
- accesscontrolgroupids: MySQL 버전마스터와 원격존 슬레이브 인스턴스에 적용된다. 인스턴스가 사용할 접근 제어 그룹의 식별자(들)마스터와 원격존 슬레이브 인스턴스에 적용된다.
상세한 설명은 createInstance 의 Request Parameters를 참조한다. (optional)
- storageType: 스토리지 유형 스토리지 유형을 설정한다.
유효값(D : 일반 디스크(기본값), SD : SSD 디스크(Seoul-M2 zone만 가능), S : SSD-provisioned) (optional)
- iops: 디스크의 IOPS값
SSD-provisioned의 IOPS값을 설정한다.
storageType이 S(SSD-provisioned)인 경우에만 유효하다.
유효값 6000 ~ 20000 사이의 값(1000단위)(optional)
- EX> python ktcloud.py database createHaGroupSingleZone instancename=testsz01

- hagroupid: 변경하고자 하는 대상 그룹의 식별자
- semisync: HA Group 내 SEMI-SYNC 관련 설정(유효값 : Y or N)
- EX> python ktcloud.py database updateHaSemiSync hagroupid=197c3448-ab4a-4bb9-86db-c5de8e79544f semisync=Y

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main(1)\WKT-Cloud-Toolkit-main>python ktcloud.py database updateHaSemiSync hagroupid=197c3448-ab4a-4bb9-86db-c5de8e79544f semisync=Y

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command     : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage       : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example     : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                        python ktcloud.py database listInstances

Input Your MSG : database updateHaSemiSync ['hagroupid=197c3448-ab4a-4bb9-86db-c5de8e79544f', 'semisync=Y']

[ktcloud] Result
{'updatehagroupsemisyncresponse': {'jobid': 'e53ed47f-0f9c-4083-bf5d-13fa97bc635e', 'hagroupid': '197c3448-ab4a-4bb9-86db-c5de8e79544f', 'semisync': 'Y'}}
```

30. updateHaGroupSlaveCount: 복제 그룹의 슬레이브 수 변경

- hagroupid: 변경하고자 하는 대상 그룹의 식별자
- slavecount: 복제본의 수, 복제본의 개수를 변경한다. (유효값 : 1 ~ 2)
- candidateids: 개수를 줄일 경우 삭제대상 인스턴스들의 식별자
복제 그룹의 복제본 수를 줄이는 경우 복제본 중 삭제할 인스턴스를 지정하는데 사용한다.
이 변수는 선택적으로 사용할수 있고 지정했을 경우 삭제수와 지정된 아이디의 수는 동일해야 한다. (optional)
- EX> python ktcloud.py database updateHaGroupSlaveCount hagroupid=cc59ad15-

7e1f-44a2-b3df-1f93700cb442 slavecount=2

31. deleteHaGroup: HA Group 삭제

- hagroupid: 복제 그룹의 식별자, 속성 변경의 대상이 되는 복제 그룹을 지정한다.
- EX> python ktcloud.py database deleteHaGroup hagroupid=cc59ad15-7e1f-44a2-b3df-1f93700cb442

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main(1)\WKT-Cloud-Toolkit-main>python ktcloud.py database deleteHaGroup hagroupid=cc59ad15-7e1f-44a2-b3df-1f93700cb442

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances

Input Your MSG : database deleteHaGroup ['hagroupid=cc59ad15-7e1f-44a2-b3df-1f93700cb442']

[ktcloud] Result
{'deletehagroupresponse': {'jobid': '94957c8e-8f5d-4e2b-81eb-77389d46d6b4', 'hagroupid': 'cc59ad15-7e1f-44a2-b3df-1f93700cb442', 'memberjobcount': '1', 'memberjoblist': [{'memberjob': [{'jobid': 'd13f9859-cbca-4f14-a2d7-28c19d947dc3', 'instanceid': '5f6beee9-3af1-4431-bf7f-84c5bacdfbc9'}]}]}}
```

32. createAccessControlGroup: 새로운 접근 제어 그룹 생성

- accesscontrolgroupname: 접근 제어 그룹명
유효값 : 1 ~ 256자의 영문자, 숫자 및 '.', '-', '_'를 포함한 문자열
- accesscontrolentries: 접근 제어를 허용할 IP
입력하지 않을 시 빈 접근 제어 그룹이 생성된다. 다수의 인자를 전달할 경우에는 ','로 분리하여 전달한다. 형식 : CIDR(optional)
- EX> python ktcloud.py database createAccessControlGroup accesscontrolgroupname=testmysql1 accesscontrolentries=172.27.0.0/16

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main(1)\WKT-Cloud-Toolkit-main>python ktcloud.py database createAccessControlGroup accesscontrolgroupname=testmysql1 accesscontrolentries=172.27.0.0/16

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances

Input Your MSG : database createAccessControlGroup ['accesscontrolgroupname=testmysql1', 'accesscontrolentries=172.27.0.0/16']

[ktcloud] Result
{'createaccesscontrolgroupresponse': {'jobid': 'd3a7a7c4-fcbb-402e-9494-e64148f1d787', 'accesscontrolgroupid': '8a6b8c45-bec2-48fe-beb5-979e64737b4e', 'accesscontrolgroupstatus': 'Available'}}
```

33. deleteAccessControlGroup: 접근 제어 그룹 삭제

- accesscontrolgroupid: 삭제할 접근 제어 그룹의 식별자
- EX> python ktcloud.py database deleteAccessControlGroup accesscontrolgroupid=9313d455-3882-4a7b-8617-9c7fb914092b

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main(1)\WKT-Cloud-Toolkit-main>python ktcloud.py database deleteAccessControlGroup accesscontrolgroupid=9313d455-3882-4a7b-8617-9c7fb914092b

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances

Input Your MSG : database deleteAccessControlGroup ['accesscontrolgroupid=9313d455-3882-4a7b-8617-9c7fb914092b']

[ktcloud] Result
{'deleteaccesscontrolgroupresponse': {'jobid': 'a6d08927-6e9b-4d6e-a37c-82d9ed3bc4a9', 'accesscontrolgroupid': '9313d455-3882-4a7b-8617-9c7fb914092b', 'accesscontrolgroupstatus': 'Deleted'}}
```

34. listAccessControlGroups: 접근 제어 그룹 정보 조회

- accesscontrolgroupids: 접근 제어 그룹의 식별자(들)
정보 조회 대상이 되는 접근 제어 그룹(들)의 식별자이다.
해당 파라미터의 값이 없을 경우에는 현재 사용자가 소유하고 있는 모든 접근 제어 그룹의 정보를 볼 수 있다. 인자가 다수 일 경우에는 ', '로 분리하여 전달한다.(optinal)
- EX> python ktcloud.py database listAccessControlGroups

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main(1)\WKT-Cloud-Toolkit-main>python ktcloud.py database listAccessControlGroups

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances

Input Your MSG : database listAccessControlGroups []

[ktcloud] Result
{'listaccesscontrolgroupsresponse': {'jobid': '553cd4a6-0466-4082-8408-c9b10c0bfff6f', 'count': '6', 'accesscontrolgrouplist': [{'accesscontrolgroup': {'accesscontrolgroupid': '11158293-6ba9-41da-aff3-dbbd907eb31e', 'accesscontrolgroupname': 'yoursqlacl', 'accesscontrolgroupstatus': 'Available', 'accesscontrolgroupcreationtime': '2020-12-08 11:48:49'}, {'accesscontrolgroupid': '55a56689-4a57-417c-8548-c4d6c8408c9b', 'accesscontrolgroupname': 'test', 'accesscontrolgroupstatus': 'Available', 'accesscontrolgroupcreationtime': '2020-12-05 18:37:53'}, {'accesscontrolgroupid': '9313d455-3882-4a7b-8617-9c7fb914092b', 'accesscontrolgroupname': 'mysql10000', 'accesscontrolgroupstatus': 'Available', 'accesscontrolgroupcreationtime': '2020-11-05 14:50:20'}, {'accesscontrolgroupid': '95d7029f-05bb-457e-930f-00b429ab2ebb', 'accesscontrolgroupname': 'KIUNSEN', 'accesscontrolgroupstatus': 'Available', 'accesscontrolgroupcreationtime': '2020-12-17 16:01:11'}, {'accesscontrolgroupid': '9a3a7339-a98f-41a3-ac48-6eeea28alf63', 'accesscontrolgroupname': 'smj', 'accesscontrolgroupstatus': 'Available', 'accesscontrolgroupcreationtime': '2020-12-17 13:38:47'}, {'accesscontrolgroupid': 'a6d39205-5474-48d2-979e-9f3914157fc3', 'accesscontrolgroupname': 'sdktest1', 'accesscontrolgroupstatus': 'Available', 'accesscontrolgroupcreationtime': '2021-01-08 02:17:03'}]}}}
```

35. listAccessControlGroupEntries: 접근 제어 그룹의 구성 IP 정보 조회

- accesscontrolgroupid: 접근 제어 그룹의 식별자
조회 대상이 되는 접근 제어 그룹의 식별자이다.
- EX> python ktcloud.py database listAccessControlGroupEntries accesscontrolgroupid=11158293-6ba9-41da-aff3-dbbd907eb31e

```
C:\WCL1_SDK\WKT-Cloud-Toolkit-main(1)\WKT-Cloud-Toolkit-main>python ktcloud.py database listAccessControlGroupEntries accesscontrolgroupid=11158293-6ba9-41da-aff3-dbbd907eb31e

[ktcloud] ctype      : server database lb gslb nas waf
[ktcloud] command    : See Ref. https://cloud.kt.com/portal/openapi-guide/common-api_prologue-intro_api_intro
[ktcloud] Usage      : python ktcloud.py < ctype > < command > < param_name1=param1, param_name2=param2,, >
[ktcloud] example    : python ktcloud.py server startVirtualMachine zone=KR-M id=yourid
                      python ktcloud.py database listInstances

Input Your MSG : database listAccessControlGroupEntries ['accesscontrolgroupid=11158293-6ba9-41da-aff3-dbbd907eb31e']

[ktcloud] Result
{'listaccesscontrolgroupentriesresponse': {'jobid': '27dd54d1-f21a-4b90-8663-bf39e4edfd6e', 'count': '4', 'accesscontrolgroupentrylist': [{'accesscontrolgroupentry': {'ip': '0.0.0.0/0'}, {'ip': '172.27.0.0/16'}, {'ip': '14.63.254.0/24'}, {'ip': '14.63.147.0/24'}]}}}
```

참고

kt cloud CLI는 kt cloud OpenAPI와 parameter가 동일하다. 아래 링크 참조.
